Report Overview

A Chemical Oxygen Demand (COD) Analyzer is a sophisticated analytical instrument designed to measure the amount of oxygen required to oxidize organic and inorganic contaminants present in water samples. This device is crucial in assessing the pollution level of water bodies, as it quantifies the oxygen-consuming substances that can lead to oxygen depletion and subsequent harm to aquatic life. The COD Analyzer operates by introducing a known amount of a strong oxidizing agent, typically potassium dichromate, into the water sample. The sample is then heated, and the amount of oxygen consumed during the oxidation process is measured. The resulting COD value, expressed in milligrams per liter (mg/L), indicates the concentration of organic and inorganic pollutants that can be reduced by oxygen. This information is vital for water treatment processes, environmental monitoring, and compliance with water quality standards.
