Report Overview

Chemically absorbed sunscreen, also known as chemical sunscreen, contains organic (carbon-based) compounds that absorb ultraviolet (UV) radiation and convert it into heat, which is then released from the skin. Common active ingredients in chemical sunscreens include avobenzene, octinoxate, oxybenzone, and octocrylene. These sunscreens are typically lighter in texture and easier to apply evenly compared to physical sunscreens, which use mineral-based ingredients like zinc oxide or titanium dioxide to physically block UV rays. Chemical sunscreens provide broad-spectrum protection against both UVA and UVB rays and are often preferred for daily use due to their non-whitening appearance on the skin. However, they may cause skin irritation in some individuals and require reapplication more frequently, especially after swimming or sweating.
