Report Overview

Chromated Copper Arsenate (CCA) is a wood preservative chemical that is used to protect wood from decay, fungi, and insects. It is a combination of three primary compounds: chromium, copper, and arsenic. The product is typically applied to wood through a pressure treatment process, where the wood is placed in a closed vessel and the CCA chemicals are forced into the wood under high pressure. This treatment process ensures that the chemicals penetrate the wood deeply and evenly, providing long-lasting protection against wood-destroying organisms. CCA is commonly used in outdoor applications such as construction, landscaping, and marine environments where wood is exposed to harsh conditions and needs to be resistant to decay and insect damage. However, due to environmental and health concerns, the use of CCA has been phased out in many countries for certain applications, and alternative treatments have been developed.
