Report Overview

Chronic Hepatitis B Drugs refer to a class of pharmaceuticals specifically designed to treat and manage chronic Hepatitis B, a viral infection that affects the liver. These drugs work by inhibiting the replication of the Hepatitis B virus (HBV), thereby reducing the viral load in the body and slowing down the progression of liver damage. The primary goal of treatment is to prevent the development of liver cirrhosis, liver failure, and hepatocellular carcinoma. Chronic Hepatitis B Drugs include nucleos(t)ide analogs, such as tenofovir disoproxil fumarate, entecavir, and lamivudine, which are prescribed to patients with active viral replication and elevated liver enzymes. These medications are typically taken orally and require long-term administration to maintain their therapeutic effects. The choice of drug and treatment duration is guided by factors such as the patient's age, liver function, viral load, and the presence of other health conditions.
