Abstracts

Chronic wounds, which are wounds that fail to progress through the normal stages of healing, often require advanced treatment strategies like interactive dressings. These dressings are designed to actively participate in the healing process by maintaining a moist wound environment, controlling exudate, and providing protection from infection. Interactive dressings can include materials like hydrogels, hydrocolloids, and alginates, which interact with the wound bed to promote tissue regeneration and accelerate healing. Additionally, some advanced dressings incorporate antimicrobial agents or growth factors to further enhance wound healing. By addressing the complex needs of chronic wounds, interactive dressings play a crucial role in improving patient outcomes and reducing healing times.
