### Report Overview

Circulating tumor DNA (ctDNA) is found in the bloodstream and refers to DNA that comes from cancerous cells and tumors. Most DNA is inside a cell's nucleus. As a tumor grows, cells die and are replaced by new ones. The dead cells get broken down and their contents, including DNA, are released into the bloodstream. ctDNA are small pieces of DNA, usually comprising fewer than 200 building blocks (nucleotides) in length. The quantity of ctDNA varies among individuals and depends on the type of tumor, its location, and for cancerous tumors, the cancer stage. Circulating-tumor DNA (ctDNA) refers to fragments of DNA derived from tumor cells and circulating in the blood together with cell-free DNA from other sources. Circulating tumor DNA (ctDNA) analyses are minimally invasive and accessible for risk stratification or treatment response monitoring of cancer patients. Compared to tumor biopsy analysis, they are not only less invasive, but also provide a more representative picture, allowing capturing both tumor heterogeneity and multiple tumor sites.
