Abstracts

Class B fireproof aluminum composite panel (ACP) also aluminum composite material (ACM) is a type of flat panel that consists of two thin aluminum sheets bonded to a non-aluminum core. Aluminum sheets can be coated with PVDF, fluoropolymer resins (FEVE) or Polyester paint. Aluminum can be painted in any kind of color, and ACPs are produced in a wide range of metallic and non-metallic colors as well as patterns that imitate other materials, such as wood or marble. The core is commonly low density polyethylene, or a mix of low density polyethylene and mineral material to exhibit fire retardant properties. ACPs are frequently used for external cladding or facades of buildings, insulation, and signage. Aluminum Composite Sheet (also known as Aluminum Composite Panel or ACP) is a widely used construction and decorative material made up of two thin aluminum sheets bonded to a non-aluminum core. The core material can be made of various materials, such as polyethylene (PE), fire-resistant material (FR), or mineral-filled material (MFR), depending on the intended application and requirements. Aluminum composite sheets are widely used in the construction industry for architectural cladding, facade systems, and interior decoration. The material's lightweight nature, durability, and design versatility make it a popular choice for modern buildings, which has driven demand from the construction sector.

The global Class B Fireproof Aluminum Composite Panel market size was estimated at USD 5631.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
