Report Overview

A clock recovery module is a hardware or software component that recaptures or recovers the clock component from the transmitted signal. Its primary role is to track clock drift and a portion of jitter on the transmitter side at the receiver side to ensure proper data sampling. This is particularly important in high-speed serial communications, where clock information is often embedded in the transmitted data stream rather than being transmitted over a separate clock line. The clock recovery module is a critical and indispensable component of modern high-speed communication systems, and its performance directly affects the transmission quality and reliability of the system.
