Report Overview

A Closed Core Transformer is an electrical device that transfers electrical energy between two or more coils, known as windings, through electromagnetic induction. It is designed with a closed magnetic core, typically made of ferromagnetic materials like iron or steel, which helps to confine and direct the magnetic field generated during the energy transfer process. This closed core design enhances the efficiency of energy transfer and reduces magnetic leakage, making it suitable for applications requiring high efficiency and low magnetic interference. Closed Core Transformers are commonly used in power distribution systems, industrial equipment, and electronic devices where the control of magnetic flux and high efficiency are critical.
