Abstracts

The intravenous indwelling needle is a closed infusion system that integrates the cannula, extension tube, and heparin cap. This structure allows nurses to avoid contact with blood during the entire operation, thereby avoiding diseases caused by blood exposure. The intravenous indwelling needle is mainly used for intravenous infusion, and is placed in the patient's vein in a short period of time through the cannula, which can realize multiple infusions. The cannula is made of soft material with good tissue compatibility. During the indwelling period, the cannula makes the patient feel more comfortable and protects the blood vessels.
