Abstracts

Closed-loop feedback control phase-locked loop is an electronic circuit or system based on the principle of closed-loop feedback control. A phase-locked loop can be used to generate an output signal of a specific frequency and is widely used in frequency synthesizers and wireless communication devices in communication systems. Its main function is to synchronize the phase of the output signal with the phase of the input reference signal (phase-locked) through a feedback mechanism. The input signal of the phase-locked loop is a periodic signal, usually a reference signal with a known frequency, such as from an oscillator or other timing signal source.

The global Closed-Loop Feedback Control Phase-Locked Loop market size was estimated at USD 2728.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
