Report Overview

A Closed Microwave Digester is a laboratory device utilized for the process of sample digestion, which is a crucial step in various analytical procedures such as atomic absorption spectroscopy (AAS), inductively coupled plasma (ICP), and inductively coupled plasma mass spectrometry (ICP-MS). This device operates by employing microwave energy to heat and accelerate the breakdown of complex organic and inorganic materials in samples, such as soil, water, and biological tissues, into simpler, soluble forms. The closed system design ensures safety and efficiency by containing the high pressures and temperatures generated during the digestion process, which can reach up to several hundred degrees Celsius and dozens of atmospheres. This allows for faster digestion times, reduced reagent consumption, and improved sample throughput compared to traditional open-vessel digestion methods. The closed nature of the system also minimizes the risk of sample contamination and loss, enhancing the accuracy and reliability of analytical results.
