Abstracts

Antisense oligonucleotides are single-stranded oligodeoxynucleotides that can alter the RNA and modify protein expression. These oligonucleotides were discovered to influence RNA processing. Subsequent chemical modifications of antisense oligonucleotides were used to address issues such as off-target toxic effects and insufficient biological activity. These modifications led to an improved mechanism of antisense oligonucleotides and clinical trial design. This paved the way toward translating their use into therapies for various genetic and neurological conditions. Antisense oligonucleotides mediated therapies target the source of pathogenesis and have higher chance of success as compared to therapies that target downstream pathways. These are drugs for the treatment of central nervous system (CNS) disorders, as they have specific molecular targeting and extended pharmacological properties.

The global Cns Specific Antisense Oligonucleotides market size was estimated at USD 850.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.65% during the forecast period.
