### Report Overview

Carbon nanotube (CNT) pellicles for extreme ultraviolet (EUV) lithography are ultra-thin, transparent membranes composed of aligned or networked carbon nanotubes. These pellicles serve as protective layers in semiconductor manufacturing, shielding the photomask from contamination while allowing high transmission of EUV light (13.5 nm wavelength). Unlike traditional silicon-based pellicles, CNT variants offer superior mechanical strength, thermal stability, and radiation resistance, critical for maintaining mask integrity under intense EUV exposure. Their nanoscale porosity ensures minimal light absorption, addressing key challenges in next-generation chip fabrication, such as defect control and throughput efficiency. The technology is positioned as an enabling solution for advanced nodes (sub-3nm) where conventional pellicles face durability limitations.

This report provides a deep insight into the global CNT Pellicles for EUV Lithography market covering all its essential aspects.
