Report Overview

Co-packaged optics (CPO) technology integrates optical components directly with silicon chips or ASICs (application-specific integrated circuits) in a single package, eliminating the need for traditional pluggable optical transceivers. This approach reduces power consumption, latency, and physical footprint while improving bandwidth density—critical for high-performance computing (HPC), AI/ML workloads, and next-generation data centers facing escalating data demands. CPO replaces electrical interconnects with optical signaling at shorter distances, enabling faster data transfer rates (beyond 1.6Tbps) and addressing the limitations of copper-based solutions in hyperscale environments. The technology is still emerging, with standardization efforts underway (e.g., COBO, OIF), and faces challenges in thermal management, yield optimization, and ecosystem maturity. Key adopters include cloud service providers, semiconductor firms, and telecom operators investing in 800G/1.6T infrastructure. The market is projected to grow significantly, driven by AI expansion and 5G/6G deployments, but widespread commercial adoption hinges on cost reduction and interoperability advancements.
