Abstracts

Coated intermittent catheters were developed with the intent to reduce long term complications of the urethra due to catheterization. There are catheters coated with ready-to-use solutions, hydrophilic coatings, gel on the catheter surface, or gel inside the wrapping. Coated catheters are designed for single-use and allow for smooth insertion and removal, lowering the chances of urethral mucosal irritation. There are two types of coated intermittent catheters: Hydrophilic coated catheters and Antibiotic coated catheters. A significant driver in the Coated Intermittent Catheters market is the increasing recognition of the importance of infection prevention and patient comfort during catheterization procedures. Coated intermittent catheters, often equipped with hydrophilic or antimicrobial coatings, offer a more comfortable and safer option for managing urinary retention while reducing the risk of urinary tract infections. However, a notable challenge in this market is the need for cost-effectiveness and accessibility. Ensuring that coated catheterization solutions are affordable and accessible to a broad range of patients, including those in resource-limited settings, poses a significant challenge. Healthcare providers and manufacturers must focus on pricing strategies, technology advancements, and market reach to make coated intermittent catheters widely available while maintaining high product quality and infection prevention benefits.

The global Coated Intermittent Catheters market size was estimated at USD 318.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
