Report Overview

The Cobalt-Based Alloy Rapamycin-Eluting Stent System is a state-of-the-art medical device designed for use in percutaneous coronary intervention (PCI) procedures. This system consists of a stent made from a cobalt-based alloy, which is known for its superior strength and flexibility. The stent is coated with a drug-eluting layer containing rapamycin, a potent immunosuppressive drug that inhibits cell proliferation and migration. The primary function of this system is to treat coronary artery disease by mechanically opening the blocked artery and releasing rapamycin to prevent restenosis, or re-narrowing, of the artery. The combination of the durable and biocompatible alloy with the targeted drug delivery aims to provide an effective and long-lasting solution for patients with coronary artery disease, reducing the need for repeat interventions and improving patient outcomes.
