Report Overview

The Coil System for Embolization is a medical device designed for the purpose of occluding blood vessels or stopping blood flow in specific areas of the body. This system typically consists of a collection of small, flexible, and often helically-shaped coils made from materials such as platinum, stainless steel, or other biocompatible metals. These coils are delivered through a catheter to the target site within the vascular system, where they are released to create a blockage. The embolization process is used to treat various conditions, including aneurysms, arteriovenous malformations, and certain types of tumors, by cutting off their blood supply. The Coil System for Embolization may also incorporate additional features such as detachable mechanisms, allowing for precise placement and control, and may be used in conjunction with other embolic agents to achieve optimal therapeutic outcomes.
