Abstracts

The cold atomic absorption mercury meter is a specialized instrument used for the detection and measurement of mercury levels in various samples. It employs the principle of atomic absorption spectroscopy to precisely quantify the concentration of mercury present. The 'cold' aspect refers to the technique used to minimize the interference from other elements in the sample, thus enhancing the accuracy of mercury detection. This meter consists of a sample introduction system, a light source to generate specific wavelengths, and a detector that measures the absorption of light by mercury atoms. It finds application in environmental monitoring, industrial processes, and research settings to ensure compliance with safety regulations and assess potential hazards.
