## Abstracts

Cold field emission electron microscope (CFE-SEM or FE-SEM for short) is an advanced electron microscope technology. Cold field emission electron microscope uses cold field emission technology to generate high-energy electron beams, which scan the sample surface after focusing and accelerating. During the scanning process, the electron beam interacts with the sample surface to stimulate various physical signals, such as secondary electrons, backscattered electrons, characteristic X-rays, etc. By collecting and processing these signals, high-resolution images and microstructural information of the sample surface can be obtained. Cold field emission electron microscopes are widely used in materials science, life science and other fields. The research needs in these fields are an important factor driving the development of the cold field emission electron microscope market. As a high-end scientific instrument, the technical development of cold field emission electron microscopes is the key to market development. With the continuous advancement of electron microscopy technology, the performance of cold field emission electron microscopes will be further improved to meet a wider range of application needs. With the continuous development of science and technology, the application of cold field emission electron microscopes in scientific research, industry and other fields will be more extensive. At the same time, with the continuous advancement of technology and the reduction of costs, the popularity of cold field emission electron microscopes will gradually increase.
