Report Overview

Cold Formed Parts are parts produced through processes known as cold heading, or impact extrusion, which are both types of cold forming. Cold forming is a manufacturing process, where a metal blank is shaped into a part by using various types of presses. This is a unique parts manufacturing process that results in no loss of material, which saves a significant amount of money. The basic cold forming process uses a simple metal blank that is cut from solid wire or bar stock, then placed in a punch and die set that is mounted on a vertical, mechanical or hydraulic press. Then the metal blank is simply pressed into the desired shape using extreme pressure. The mechanical force of the punch causes the metal to literally "flow" around the punch and take the shape of the die. Since this process is performed at room temperature, with no heat applied to the metal blank, the process is called "cold forming" and the parts produced are referred to as "cold formed parts."
