### Report Overview

Cold forming blister foil is a specialized packaging material primarily used in the pharmaceutical industry to protect sensitive medications from moisture, light, and oxygen. It consists of multiple layers, typically including aluminum for barrier properties and polymer films for formability and sealing. The foil is cold-formed (rather than heat-sealed) to create blisters that securely hold tablets or capsules, ensuring product integrity and extended shelf life. Its key advantages include superior protection compared to traditional PVC-based blister packs, enhanced tamper-evidence, and compatibility with high-speed packaging lines. The demand for cold forming blister foil is driven by stringent regulatory requirements in pharmaceuticals, the growth of moisture-sensitive biologics and specialty drugs, and increasing emphasis on patient compliance through unit-dose packaging. Major end-users include pharmaceutical manufacturers, contract packaging companies, and nutraceutical producers, with innovation focusing on sustainable material alternatives and improved barrier performance.
