Abstracts

Cold In-place Recycling (CIR) equipment is used in road construction and maintenance to rehabilitate existing asphalt pavements by recycling the materials in-place without the need for extensive excavation. CIR equipment typically involves a train of machinery that performs several key functions, including milling or pulverizing the existing pavement surface, adding recycling agents or rejuvenators to improve the properties of the recycled material, mixing the recycled material with new asphalt binder or emulsion, and compacting the mixture back into a durable and smooth pavement surface. This process effectively restores the structural integrity and ride quality of deteriorated pavements while reducing material waste, energy consumption, and greenhouse gas emissions compared to traditional methods of pavement rehabilitation.

The global Cold In Place Recycling Cir Equipment market size was estimated at USD 125.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
