Report Overview

Cold Junction Compensation is a technique used in temperature measurement systems to correct for the effects of temperature variations at the Cold Junction, which is the point where the temperature-measuring probe (e.g., thermocouple or resistance temperature detector) is connected to the measuring instrument. When a temperature probe is used, the Cold Junction temperature can differ from the reference temperature (usually the ambient temperature), leading to measurement errors. Cold Junction Compensation involves measuring and accounting for this temperature difference to ensure accurate temperature readings.
