Report Overview

A Cold Radiant Panel is a type of passive cooling technology used in building design and construction. It is a flat, panel-like structure that emits cool air through a process known as radiant cooling. This technology operates by absorbing heat from the surrounding environment and transferring it away from the space, thereby reducing the need for traditional air conditioning systems. Cold Radiant Panels are typically installed on ceilings or walls and can be made from materials such as aluminum or copper, which have high thermal conductivity. They work by absorbing heat from the air and the surfaces they come into contact with, and then dissipating this heat through radiation and convection. This results in a cooler and more comfortable indoor environment, making them an energy-efficient alternative to conventional cooling methods.
