Report Overview

Cold Upsetting Former, also known as cold heading or cold forging, is a metalworking process in which a metal blank is shaped into a desired form by compressive forces applied through dies or punches. This process is typically performed at room temperature, without the need for heat, and results in a significant increase in the strength and hardness of the material. Cold upsetting formers are commonly used in the production of fasteners, such as bolts, screws, and rivets, as well as other precision components. The process involves the use of specialized machinery, such as presses or forging hammers, to apply the necessary force to the metal blank. The advantages of cold upsetting formers include improved material properties, reduced material waste, and the ability to produce complex shapes with tight tolerances.
