### Report Overview

Collimating lenses are usually made of curved mirrors that are aligned to optimize the collection of light from the light source. This allows the light to be seen without parallax. The lens prevents the light from scattering in different directions, allowing the user to configure illumination in parallel directions. Collimating lenses are available as single beam collimators and achromatic beam collimators. Most collimators are made of materials such as lead, tin, tungsten, bismuth, molybdenum, and high-density plastics. The design and manufacturing process of collimating lenses involves the molding, polishing, coating, assembly, and testing of the lenses.
