Report Overview

Collinear acousto-optic tunable filter is a new type of spectroscopic device based on the acousto-optic effect. The collinear acousto-optic tunable filter is a tunable filter that uses the acousto-optic effect and works under specific conditions (i.e., the acoustic wave vector and the optical wave vector are collinear). It can select output light of different wavelengths from the input wide-spectrum light by changing the frequency of the input electrical signal, thereby realizing precise modulation and control of the spectrum. The working principle of the collinear acousto-optic tunable filter is mainly based on the acousto-optic effect. When ultrasonic waves propagate in a medium, they cause periodic changes in the refractive index of the medium, thereby spatially modulating the incident light. This modulation effect includes transverse spatial modulation components and longitudinal spatial modulation components. The transverse spatial modulation component deflects the incident light beam into a certain angular distribution according to the spectrum of the acoustic wave, while the longitudinal spatial modulation component spectrally modulates the incident light. Under collinear conditions, by selecting appropriate acoustic wave frequencies and optical wave frequencies, light of a specific wavelength can pass through the filter, while light of other wavelengths is filtered out.
