Report Overview

A colorimetric urine analyzer is a medical diagnostic device designed to assess various parameters in urine samples. It operates on the principle of colorimetry, which involves measuring the color intensity of a solution to determine the concentration of specific substances. This analyzer typically consists of a digital reader and a set of test strips that change color when they come into contact with urine. The reader then measures the color change, which corresponds to the concentration of different components such as pH, specific gravity, protein, glucose, ketones, bilirubin, urobilinogen, nitrite, and leukocytes. These measurements are crucial for diagnosing and monitoring various health conditions, including kidney diseases, urinary tract infections, and diabetes. The device provides rapid, objective results, making it a valuable tool in clinical settings for both initial screenings and ongoing patient management.
