### Report Overview

A Commercial Prebaked Anode is a specialized type of anode used in the aluminum smelting process. It is a carbon-based product, typically made from petroleum coke and coal tar pitch, which serves as an electrode in the Hall-Héroult process. This process involves the electrolytic reduction of alumina (aluminum oxide) dissolved in molten cryolite to produce aluminum metal. The prebaked anode is called "prebaked" because it is baked at high temperatures before being used in the electrolytic cell, which hardens the anode and reduces its electrical resistance. This baking process also helps to minimize the anode's consumption rate during the smelting process, thereby improving the efficiency and longevity of the anode. The commercial aspect of the product refers to its mass production and use in the industrial-scale production of aluminum.
