Report Overview

An autocorrelator is used to measure the pulse duration. The basic principle is to use a beam splitter to create two copies of the incoming beam. These copies are superimposed in a nonlinear medium, where they interact to produce a third beam. Since the overlap of the two copies depends on the pulse duration, analysis of the third beam allows calculation of the pulse duration. The compact autocorrelator is very compact and very easy to use. Measure in just two minutes!
