Report Overview

A compact pneumatic vibration isolator is a device designed to reduce the transmission of vibrations from one object to another. It employs pneumatic technology to isolate the vibrations by effectively decoupling the two objects. The isolator typically consists of a flexible pneumatic element or bladder filled with air or gas, which acts as a cushion between the objects. When subjected to vibrations, the bladder compresses and expands, absorbing the energy and reducing the transmission of vibrations. This type of isolator is often used in sensitive equipment or machinery to protect them from external vibrations and ensure smooth and stable operation. Additionally, the compact design makes it suitable for applications with limited space.
