Report Overview

Complementary DNA Probes, often abbreviated as cDNA probes, are laboratory tools used in molecular biology and genetics. They are synthesized DNA sequences that are complementary to a specific messenger RNA (mRNA) sequence, enabling them to bind to the mRNA through base pairing. cDNA probes are typically generated by reverse transcription, a process where an enzyme called reverse transcriptase converts mRNA into a complementary DNA strand. These probes are widely used for various applications, including gene expression analysis, detection of specific genes, and studying gene regulation. They play a crucial role in research areas such as diagnostics, gene mapping, and the investigation of genetic diseases, offering a sensitive and specific method to identify and quantify target nucleic acid sequences within complex biological samples.
