Report Overview

A component leveller is a machine or device used in the manufacturing and assembly processes to flatten or level metal components that have become warped or bent. These machines are commonly used in industries such as automotive, aerospace, metalworking, and sheet metal fabrication, where precision and flatness are critical for the proper fit and function of parts. The levelling process involves applying force to the bent or warped component to straighten it out. This is typically done by clamping the metal piece between two rolls that rotate at different speeds. As the material passes through the rolls, the slower roll applies more force to the material than the faster roll, which causes the metal to bend in the opposite direction of the warp, thereby levelling it.
