Report Overview

Compound Mannitol Injection is a hyperosmolar diuretic solution primarily used in clinical settings to reduce intracranial and intraocular pressure, treat cerebral edema, and manage acute renal failure by promoting osmotic diuresis. It consists of mannitol, a sugar alcohol, dissolved in sterile water, often with additional electrolytes to maintain osmotic balance. The product is administered intravenously and works by drawing fluid from tissues into the bloodstream, which is then excreted by the kidneys. Its applications span neurology, ophthalmology, and nephrology, making it a critical therapeutic agent in emergencies and post-surgical care. The formulation must meet stringent pharmacopoeial standards to ensure safety, sterility, and efficacy, given its direct intravenous use in high-risk medical conditions.
