Computational Predictive Toxicology Modeling based on (Quantitative) Structure-Activity Relationships [(Q)SAR] and metabolic modeling have emerged as fundamental tools in the preliminary safety screening of novel molecules, such as plant extracts, fermentation products, or fungal secondary metabolites that are intended for use in food. Computational Predictive Toxicology Modeling Service is a professional service that provides the use of computer models and computational methods to predict the toxic effects of chemical substances. Combining chemistry, biology, computer science, and data analysis, this service aims to assess the toxic potential of chemicals to living organisms to support decision-making in areas such as drug discovery, chemical safety assessment, and environmental protection. Collect multiple data sources on chemical substance properties, molecular structure, biological activity, and toxicity test data. Features of chemical substances are extracted from the collected data, which may include molecular descriptors, physicochemical properties, metabolic pathways, etc. Using methods such as machine learning, statistics, and computational chemistry, build predictive models that correlate characteristics of chemical substances with their toxic effects. Validate the model, evaluate its predictive performance using an independent test dataset, and refine the model to improve accuracy. Use the optimized model to predict the toxicity of new chemical substances and explain the prediction results. Based on model predictions, assess the toxicity potential of chemicals and generate reports that provide decision makers with information on potential toxicity. Computational predictive toxicology modeling services can help speed up the toxicity assessment process, reduce the need for animal experiments, and reduce cost and time investment. It has broad application prospects in drug research and development, new chemical development, food additive safety assessment and other fields.

The global Computational Predictive Toxicology Modeling Service market size was estimated at USD 200.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
