Abstracts

Computed Radiography (CR) Detector is a digital imaging technique used to acquire and process X-ray images. It works by passing X-ray radiation through a substance called a scintillation screen, which converts it into light, which is then focused onto a light-sensitive detector using an optical system. The detector converts light into electrical signals, which are converted into digital signals by an AD converter, and then sent to a computer for processing and display. CR detectors can be used in fields such as medical diagnosis, industrial inspection and safety inspection.

The global Computed Radiography Cr Detector market size was estimated at USD 320.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
