Report Overview

Concrete expansion joint systems are structural elements used in construction to accommodate the natural movement and expansion of concrete structures caused by temperature changes, seismic activity, or settlement. These systems consist of joint fillers and sealants installed in gaps or joints between adjacent concrete elements, such as slabs, walls, or columns. The joint fillers absorb movement stresses, while the sealants prevent the infiltration of water, debris, or other materials, maintaining the integrity of the structure. Concrete expansion joint systems are crucial for preventing cracking, spalling, and other forms of damage in concrete structures, ensuring durability and longevity in various applications, including highways, bridges, buildings, and industrial facilities.
