Report Overview

Conductive Au Particles, also known as gold particles, are a type of nanomaterial that possess unique electrical and optical properties due to their gold composition. These particles are engineered to have a specific size, shape, and surface chemistry, which significantly influence their conductive capabilities. They are widely used in various applications, including electronics, where they enhance the performance of devices by providing efficient pathways for electron flow. Additionally, their optical properties make them valuable in fields such as sensing, imaging, and photothermal therapy. The conductive nature of Au Particles arises from the delocalized electrons in gold, which allow for high electrical conductivity. This characteristic, combined with their biocompatibility and stability, positions them as a key component in advanced technological and medical applications.
