Abstracts

Conductive carbon-coated aluminum foil is a popular substrate/current collector in battery R&D and industry. Compared with bare aluminum foil, conductive carbon-coated aluminum foil has the advantages of improving electrical conductivity and reducing internal resistance, improving adhesion at the active layer/current collector interface, inhibiting battery polarization and short circuit caused by dendrite growth, and preventing substrate damage caused by electrolyte. The overall battery performance can benefit from these advantages, including higher charge/discharge capacity, better rate performance and cycle performance. This paper mainly studies conductive carbon-coated aluminum foil for lithium batteries.

The global Conductive Carbon Coated Aluminum Foil For Lithium Batteries market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.85% during the forecast period.
