### Report Overview

Conductive superhard film layer is a composite film layer that achieves high hardness, high wear resistance and good conductivity by coating or depositing a specific material layer on the surface of the material. This film layer is usually used to improve the performance of electronic products, extend their service life and enhance their stability in various environments. Conductive superhard film layers are usually composed of a multilayer structure, including a substrate layer, a conductive layer and a protective layer. The preparation process of conductive superhard film layers is diverse, mainly including sputtering, evaporation, chemical vapor deposition, etc. Among them, sputtering is the most widely used process for preparing transparent conductive films, including DC and RF reactive and non-reactive sputtering, as well as magnetron sputtering and ion beam sputtering.
