### Report Overview

A Conical Separatory Funnel is a laboratory glassware designed for the separation and purification of liquid mixtures. It features a conical shape with a narrow neck, which facilitates the efficient separation of immiscible liquids based on their differing densities. The funnel is typically made of borosilicate glass, known for its resistance to thermal shock and chemical corrosion. It is equipped with a stopcock or a tap at the bottom, allowing for the controlled drainage of the lower, denser liquid while the upper, less dense liquid remains in the funnel. This design is particularly useful in procedures such as liquid-liquid extractions, where the goal is to separate components of a mixture into two distinct phases. The conical shape of the separatory funnel also aids in minimizing the risk of emulsion formation, which can complicate the separation process.
