Report Overview

Conization electrodes are specialized medical devices used in the field of gynecology, specifically for the procedure known as conization or cone biopsy. This procedure is performed to remove abnormal tissue from the cervix, often as a diagnostic measure to detect or confirm cervical cancer or precancerous conditions. Conization electrodes are typically made of metal and are designed to be used with electrosurgical units, which provide the necessary electrical current for cutting and coagulating tissue. The electrodes are shaped to facilitate the removal of a conical section of tissue from the cervix, allowing for a thorough examination of the tissue sample. They are an essential tool in the management of cervical dysplasia and cancer, contributing to the early detection and treatment of these conditions.
