## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Consumer Electronics MIM Parts competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Consumer Electronics MIM (Metal Injection Molding) Parts refer to small, precision-engineered metal components manufactured using the MIM process and specifically designed for use in consumer electronic devices. These components are typically compact, intricate, and require high levels of dimensional accuracy and aesthetic finish?features that MIM technology is well-suited to deliver. The MIM process combines the design flexibility of plastic injection molding with the material strength and durability of metal to produce complex geometries in a cost-effective and scalable manner. In the context of consumer electronics, MIM parts are found in smartphones, tablets, laptops, smartwatches, earbuds, gaming devices, and other wearable or handheld electronic products. The MIM process begins with a mixture of fine metal powders and a thermoplastic binder, which is injected into a precision mold to form a ?green part.? After molding, the binder is removed through a debinding process, and the part is sintered at high temperatures to fuse the metal particles together. The final component is a dense metal part that offers mechanical strength, corrosion resistance, and surface finish suitable for both functional and cosmetic purposes. Stainless steel is the most commonly used material for consumer electronics MIM parts due to its strength, resistance to wear and corrosion, and attractive appearance. The application of MIM technology in consumer electronics is driven by the industry's need for lightweight, compact, and aesthetically pleasing components that can be mass-produced with tight tolerances. Typical MIM components in this sector include hinges, brackets, sliders, connectors, mechanical buttons, internal structural parts, and small gears or shafts. For example, in smartphones, MIM parts are used in camera modules, SIM card trays, and

button mechanisms. In smartwatches and earbuds, MIM enables the creation of durable, miniaturized enclosures and mechanical linkages that must withstand repeated use and exposure to environmental factors like moisture and sweat. From a market perspective, the demand for MIM parts in consumer electronics has experienced rapid growth over the past decade and continues to expand. The widespread global adoption of smartphones and the growing popularity of wearable technology have significantly increased the volume and diversity of MIM parts required. Companies like Apple, Samsung, Huawei, and Xiaomi use MIM parts extensively in their devices, not only for functional purposes but also for the premium feel and refined finishes that consumers expect from high-end products.

The global Consumer Electronics MIM Parts market size was estimated at USD 1897.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.70% during the forecast period.
