Report Overview

A Container Firewall is a specialized network security solution designed to protect and manage the traffic flow between individual containers within a containerized environment, such as Docker or Kubernetes. It operates at the network layer, filtering and monitoring incoming and outgoing traffic to and from containers to prevent unauthorized access, data breaches, and other security threats. The product typically offers features like intrusion detection and prevention, application layer filtering, and the ability to enforce security policies based on container metadata, network behavior, and user-defined rules.
