Report Overview

Continuous Flight Augering (CFA) is a construction technique used for the installation of deep foundations, such as piles and piers. It involves the use of a hollow-stemmed auger, which is continuously rotated and driven into the ground to create a cylindrical hole. As the auger is advanced, soil is displaced and removed through the hollow stem. The process is repeated until the desired depth is reached. Once the hole is formed, steel reinforcement bars (rebar) are inserted, and concrete is pumped into the hole through the auger's hollow stem. The auger is then gradually withdrawn, leaving the concrete to set and form a strong, cylindrical pile. CFA is known for its speed, efficiency, and minimal environmental impact, making it a popular choice for various construction projects.
