Report Overview

COMS (Continuous Opacity Monitoring Systems) uses light to determine opacity levels. A light shone across a stack bounces off a mirror on the other side and returns to be measured. How much light went out versus how much came back is used to calculate the % opacity value. Using this system a plant can calculate the accurate opacity percentage and make sure all EPA regulations are met (a typical opacity limit is no greater than 20%). Continuous opacity monitors are typically used by facilities which rely on waste materials, oil, coal, wood or other fossil fuels for combustion. Natural gas combustion sources don't measure opacity as the burning of natural gas does not produce smoke.
