Report Overview

A Coolant Flow Switch is a critical component in automotive and industrial cooling systems, designed to monitor and regulate the flow of coolant. This switch is typically installed in the coolant circuit to ensure that the coolant is circulating effectively, preventing overheating and maintaining optimal operating temperatures. It functions by detecting changes in the flow rate of the coolant, either through a mechanical float or an electronic sensor, and sending a signal to the vehicle's control module or an external monitoring system when the flow rate falls below a predetermined threshold. This allows for immediate identification of potential issues such as blockages, leaks, or pump failures, thereby enhancing system reliability and preventing damage to the engine or other components. The Coolant Flow Switch is an essential safety and performance feature in various applications, including automotive engines, industrial machinery, and heating, ventilation, and air conditioning (HVAC) systems.
