Abstracts

Cooled infrared detectors generally refer to detectors made using the photon effect of semiconductor materials. The photoelectric effect requires the semiconductor to be cooled to a lower temperature before it can be observed, so the infrared system needs to be cooled before it can be used. Due to the advantages of refrigerated infrared detectors such as high sensitivity, the ability to distinguish more subtle temperature differences, fast response speed, and long detector distance, they are widely used in high-end weapons and equipment. The detector unit is a detector made based on the photoconductivity effect. It uses the property of semiconductor materials that the conductivity changes under light to convert the received light signal into an electrical signal output. This detector has the characteristics of fast time response, large output current, small size, and light weight. It shows high sensitivity to various radiations such as X-rays, visible light, and charged particles.

The global Cooled Infrared Detector Single Element market size was estimated at USD 285.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
