Report Overview

Cooled infrared detector is the core component of cooled thermal imaging system. It forms a suitable low and constant temperature environment through the cooling mechanism, so that the infrared sensitive photoelectric conversion chip encapsulated in the main body of the ultra-high vacuum Dewar can convert the infrared radiation of the scene into electrical signals, and then through the readout circuit acquisition, amplification, output, image processing, and finally form an infrared image for human eyes? observation. Indium Antimonide is a type of semiconductor material, more specifically a type of microbolometer sensor used in some cooled thermal cameras. Indium Antimonide is a crystalline semiconductor made of indium and antimony. It belongs to the III-V group and is a narrow gap semiconductor material. Detectors made of indium antimonide are sensitive between a wavelength of 1-5 μm [MWIR]. InSb sensors must be cryogenically cooled.
